

# **Library Database Application (D1 – Repository Pattern)**

## **1. Basic Project Information**

**Project Name:**

Library Database Application

**Author:**

Milana Poljanskova

**Contact:**

[mila.p.06@seznam.cz](mailto:mila.p.06@seznam.cz)

**School:**

SPŠE Ječná

**Date:**

11.01.2026

**Project Type:**

School project – database application with graphical user interface

**Notes:**

This application was created as part of a school portfolio and fulfills the D1 assignment type - Repository pattern.

## **2. User Requirements Specification**

The purpose of the application is to manage a database of books, authors, and publishers, with features for data import, report generation, and database connection configuration.

**Functional requirements (Use Cases):**

- Create, edit, delete, and view books
- Manage authors
- Manage publishers
- Link books and authors (M:N relationship)
- Transfer authorship between authors
- Import data from CSV, JSON, and XML
- Generate summary reports
- Configure database connection

**User Roles:**

- Application user (database administrator)

### **3. Application Architecture and Design Patterns**

**Design Pattern:** Repository pattern (D1)

**Architecture:**

- **User Interface (UI):** Tkinter
- **Repository Layer:** Encapsulates database access logic
- **Database Layer:** MS SQL Server
- **Configuration:** config.ini

**Design Patterns Used:**

- Repository pattern
- Separation of concerns

Each database table has its own repository class. The UI communicates only via the repository layer.

**Recommended UML Diagrams:**

- Class Diagram: showing repository classes for each table
- Deployment Diagram: showing how the application, database, and configuration interact

### **4. Application Behavior**

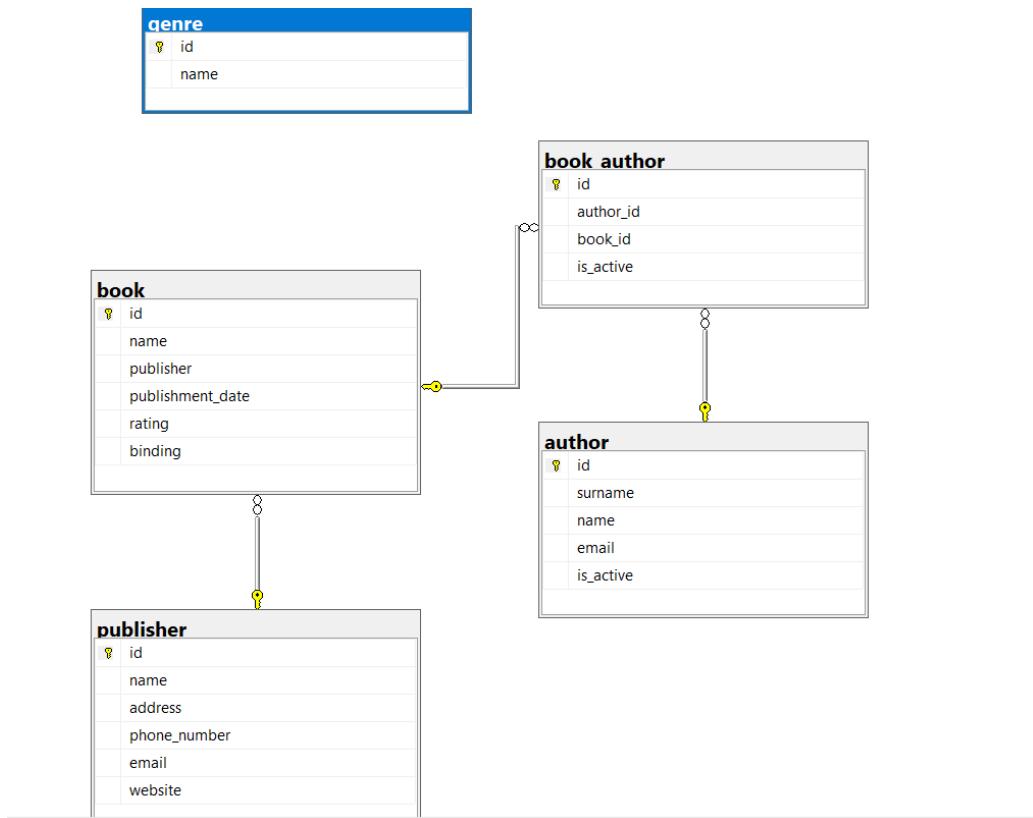

**Example: Adding a Book**

1. The user opens the “Add book” dialog.
2. Fills in book name, publisher, date, rating, binding, and authors.
3. On confirmation, data is stored in the following tables:
  - o book
  - o book\_author
4. The operation is performed in a transaction.
5. In case of an error, the transaction is rolled back.

**Recommended Behavioral Diagrams:**

- Activity diagram for adding a book
- State diagram for book-author relationships

### **5. Database Model (E-R)**

### Tables:

- book
- author
- publisher
- genre
- book\_author (M:N relationship)

### Views:

- vw\_book\_list - list of books with publisher names
- vw\_publisher\_report - aggregated publisher report

### Data Types Used:

- String: names, emails
- Float: rating
- Boolean: is\_active
- Enum: binding (hardcover, paperback, ebook)
- Date: publication\_date

### Recommended Diagram:

- E-R diagram showing tables, relationships, and attributes

## 6. Imported and Exported Files

Format	Table	Description
CSV	publisher	Import publishers
JSON	author	Import authors
XML	genre	Import genres

### Fields for CSV publisher:

- name (required)
- address (optional)
- phone\_number (optional)
- email (optional)
- website (optional)

Incorrect formats are caught and reported by the application.

## 7. Application Configuration

Configuration is stored in config.ini.

### Configurable Options:

- ODBC Driver
- Server
- Database name
- Trusted connection
- Encrypt
- Trust server certificate

Configuration can also be edited in the application via the Settings tab.

## 8. Installation and Running the Application

1. Import database structure using SQL scripts (tables.sql + views.sql).
2. Set connection options in config.ini.
3. Run the application:

`python main.py`

Detailed instructions are available in README.txt.

## 9. Error States and Solutions

Error	Description	Solution
Database connection error or server unavailable	Incorrect credentials SQL Server is running and accessible	Check settings in Settings tab or config.ini; ensure SQL Server is running and accessible
Configuration error	Missing database section in config.ini	Add database section with required options (driver, server, database, trusted_connection, encrypt, trust_server_certificate)
Invalid input	Rating outside 0–5 or invalid binding	Correct input (rating: 0–5, binding: hardcover/paperback/ebook)
Empty required fields	Required data not filled (e.g., book name, publisher)	Fill all mandatory fields before saving
Import error	Wrong file format for CSV, JSON, XML	Check file format and correct errors; application displays error message

## 10. Third-Party Libraries

- pyodbc
- tkinter
- configparser
- csv
- json
- xml.etree.ElementTree

## 11. Final Summary

The application fulfills all requirements of the D1 assignment. It uses a relational database, Repository pattern, transactions, data import, reporting, and configurable connection.

## 12. Documentation Format

The documentation is prepared as a single PDF file, created using Microsoft Word.
